

Introducing the **3-D IPS**TM *Portable & Deployable Force Protection System*

**The world's toughest
portable and easily
configurable protection
against conventional
modes of attack.**

3-Dimensional Interlocking Protection SystemTM Facts

Material is Super Protective: Advanced Anti-Ballistic CompoundTM (AABC) protects personnel and facilities from small arms fire (*including .50 BMG FMJ and AP rounds!*).

System is Mobile: AABC's relative light weight and the interlocking cube system make it far more mobile than any comparable protective barrier in existence.

System is Deployable: When used in the interlocking cube system, Advanced Anti-Ballistic CompoundTM modules are quickly assembled in the field with no tools and no need for formal instruction.

System is Configurable: Within a cubic system of any given size, all interlocking cubes, or blocks, are exactly the same. Each block fits with every other block, and the variety of structural shapes that may be configured from the cubes is unlimited.

Material and System are Extremely Durable: Advanced Anti-Ballistic CompoundTM traps and absorbs projectiles into itself, and does not degrade under attack. As projectiles are absorbed, the material gains density, becoming stronger. AABC does not support combustion. It is impervious to petrochemicals, salt water, and UV rays.
